Supervised learning is a type of machine learning where the model is trained on a labeled dataset. The goal is to learn a function that maps input features to output labels. This is done by minimizing a loss function over the training data. Common supervised learning tasks include classification and regression. The model's performance is evaluated using metrics like accuracy, precision, and recall for classification, and mean squared error for regression.

Unsupervised learning is a type of machine learning where the model is trained on an unlabeled dataset. The goal is to discover hidden patterns or structures in the data. Common unsupervised learning tasks include clustering, dimensionality reduction, and association rule learning. The model's performance is evaluated using metrics like silhouette score for clustering and explained variance for dimensionality reduction.

Transfer learning is a type of machine learning where knowledge from a source task is transferred to a target task. This is useful when the target task has limited data. The source task is used to pre-train a model, which is then fine-tuned on the target task. This can significantly improve performance on the target task. Common transfer learning tasks include image classification and natural language processing.

## Transfer learning is a type of machine learning where knowledge from a source task is transferred to a target task.

Transfer learning is a type of machine learning where knowledge from a source task is transferred to a target task. This is useful when the target task has limited data. The source task is used to pre-train a model, which is then fine-tuned on the target task. This can significantly improve performance on the target task.
